

## NowSpeak Mobile ASR for BlueCore™

Speech Recognition designed  
for Bluetooth® devices

### Features

- Speaker independent, no training by user required
- Designed for command & control applications
- Optimised for recognition in real world conditions
- Supports large vocabularies and multiple grammars
- Small footprint allows multiple languages on a device

NowSpeak Mobile ASR for BlueCore™ brings voice control to your Bluetooth device. Users can answer a call, control the device and query its status just by speaking to it.

Combined with NowSpeak TTS it is now possible to have a full voice interface for BC5MM devices. When a call comes in the device speaks the caller's name and the user can answer it, without pressing a button, by saying "accept call" or "reject call". They can make a call by saying "call home" or "call work" and check device status with commands such as "check battery".

NowSpeak has optimised its speech recognition technology to work effectively in real world conditions. Built-in noise filtering significantly reduces the effect of car noise and babble. False start detection means that "ums" and "ahs" at the beginning of phrases can be ignored.
